

Event-Ease

✓ 20 Points Explaining the Entire EventEase Setup

1. We used HTML to build the structure

All pages (Home, About, Events, Decorations, Food, Bill, Contact) were created using clean HTML to define headings, sections, buttons, forms, and content.

2. CSS was used for styling and layout

CSS gave color, spacing, borders, alignment, responsive design, and made the website visually attractive.

3. Boxes/card layouts were created using CSS Flexbox & Grid

Decoration themes, event categories, and food items were arranged in neat rows and columns using **flexbox** and **grid**.

4. Hero images were created using full-width background sections

The top section on the home page uses a **full-screen background image** with overlay text to create a modern hero banner.

5. We used high-quality royalty-free images

All event images, designs, and food visuals were kept in the /assets/ folder and displayed using tags.

6. Buttons were styled using CSS hover effects

Event selection buttons, veg/non-veg buttons, and item count buttons were styled with hover animations for smooth interaction.

7. JavaScript was used for all dynamic logic

Anything that moves, changes, calculates, updates, or appears based on user action is controlled by JavaScript.

8. JavaScript reads user selections

When the user clicks event type, decoration, food category, number of items, or enters personal details, JS captures everything using document.querySelector().

9. JavaScript stores data temporarily

Selected event, theme, food items, guest count, chair count, etc., are stored in variables or objects so they can be used later for calculations.

10. JavaScript performs bill calculations

It calculates cost for decorations, food per-plate rate, number of guests, and applies discounts (15%, 20%, 25%).

11. JavaScript updates the bill page instantly

As soon as values are selected, the total bill on the final page changes automatically—no page reload needed.

12. We used event listeners for user actions

Buttons, dropdowns, and image selections trigger code using: `addEventListener("click", function(){...})`

13. We used arrays to store food items

Veg, Non-Veg, and Both categories are stored in arrays so JS can dynamically display the items according to the user's choice.

14. PDF upload feature is handled using HTML + JS

Users can upload custom decoration designs in PDF format, and JavaScript reads the file to confirm the upload.

15. We organized the website into multiple pages

Home → About → Events → Decorations → Food → Bill → Contact

Navigation links connect all pages smoothly.

16. Smooth scrolling and page transitions were done with CSS + JS

Page jumps, button clicks, and UI movements feel smooth because of transition effects.

17. The “Refresh & Start New Event” feature resets everything

JavaScript clears all stored selections and reloads the page so a new event can be planned from scratch.

18. Form validation was used in Contact & User Details section

JavaScript checks name, phone, email, and message before submitting to ensure proper format.

19. Responsive design makes the site work on mobile

CSS media queries adjust font sizes, images, boxes, and layout for mobile screens.

20. The complete setup uses a clean folder structure

- **index.html**, about.html, events.html, food.html, contact.html
- **/assets/** for images
- **script.js** for all logic
- **styles.css** for all styling

This keeps the project professional and easy to manage.

Resume-Friendly

Developed **EventEase**, a fully interactive multi-page event management website using **HTML, CSS, and JavaScript**, featuring dynamic event selection, decoration themes, food category filtering, and instant bill calculation. Implemented **responsive layouts** using Flexbox and Grid, designed engaging **hero banners**, and built a complete **per-plate food menu system** with Veg/Non-Veg/Both options. Added real-time **JavaScript-driven logic** for capturing user inputs, generating totals, applying automated discounts (15%, 20%, 25%), and resetting the full event-planning workflow. Integrated **PDF upload support** for custom decoration ideas, form validation, smooth navigation, and a structured front-end architecture with clean asset management. This project highlights strong skills in **front-end development, UI/UX design, DOM manipulation, responsive design, and building practical web applications.**
